## Blue-Tip SCREW-BOLT™

### Blue-Tip SCREW-BOLT™s can't be beat

Proven in industrial and domestic construction markets over the past six years, Powers Fasteners Blue-Tip SCREW-BOLT™ range of universal masonry anchors has more recently been adopted by the panel beating trade.

In general, conventional sleeve anchors (Dynabolts®) are typically used to fix heavy duty jigs/racking to the concrete floor of panel beating workshops, resulting in endless problems with anchors pulling out during jig operation, unreliable installation and impracticality when removal or relocation of equipment is required.

Powers Fasteners Blue-Tip SCREW-BOLT™ provides an immediate and effective solution, offering a unique combination of benefits including extremely high load capacities, a simple, reliable installation procedure and removability, enabling relocation of equipment with a minimum of fuss.

The Blue-Tip SCREW-BOLT™'s resistance to vibration and superior holding power ensure the anchor remains secure when subjected to the considerable forces imparted during normal operation of jig equipment. Hing Cheong panel beaters found this to be true following the complete failure of sleeve anchors previously used to fix jig racking to the workshop floor. No further problems have been encountered since the anchors were replaced with Blue-Tip SCREW-BOLT™.

A wide variety of other equipment and fixtures present in the average auto workshop may also be fastened securely using the revolutionary Blue-Tip SCREW-BOLT™.
